CHAPTER 03

SPACE

Chapter 03 - Space

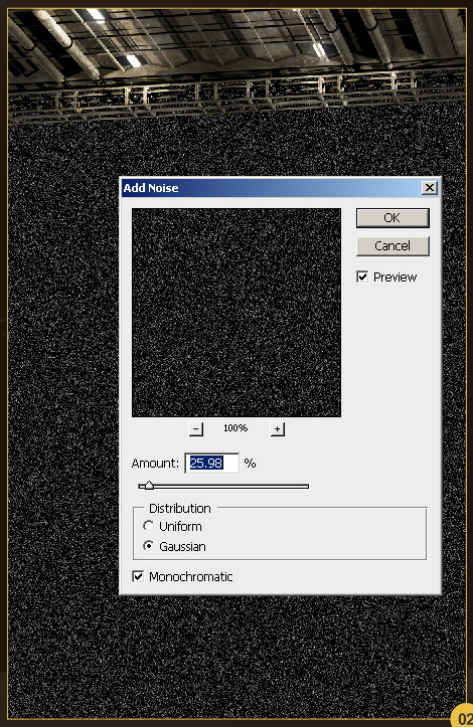

Software used: 3ds Max & Photoshop

Introduction

This tutorial focuses on creating a space environment that could make a suitable EDFNGURS WR D VFL ¿ VFHQH focus I have prepared a space hangar that deliberately leaves a large void that can be ¿OOHG LQ 3KRWRVKRS :H VKD WHFKQLTXHV XVHG WR FUHDW a look at the value of using a custom brush. No space scene would feel complete without a planet or two and so we will also look at how to add these, alongside a nebula.

01

02

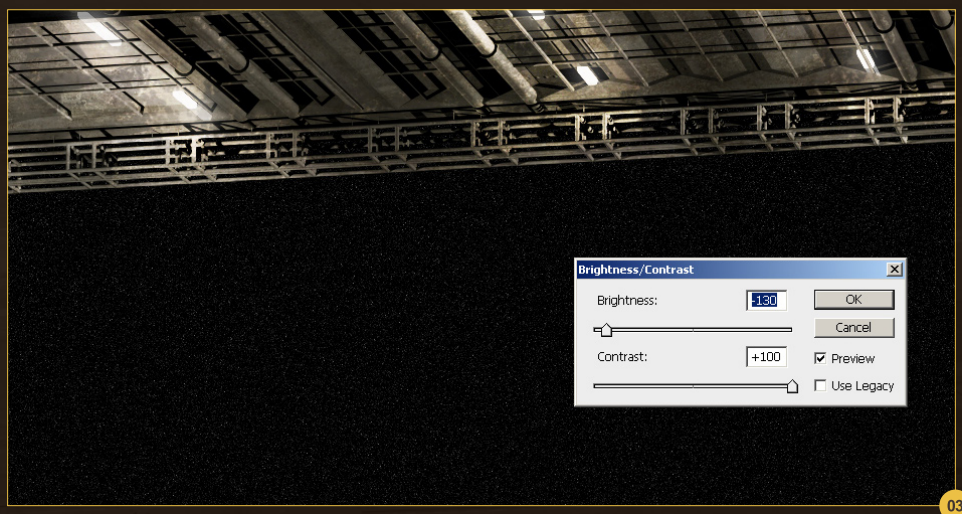

Stars

I made sure to choose a pure black as the environment color within my 3D package, for obvious reasons, and then saved out the image as a TGA in order to quickly select the background, which would be a little tricky along the ceiling edge (Fig.01 7 K H G L I ¿ F X O Wstars, after which we convey with any view into space is a sense of depth as we are looking into a void and as such there are no visible markers by which to gauge distance. Of course there are plenty of stars, but these vary in size and brightness and so can be deceiving. If you had an alignment of similar planets you could have a measuring stick, however this would look unnatural and so we need to vary the size and brightness of the star ¿HOG LQ RUGHU WR FUHDWH Dusing a custom brush.

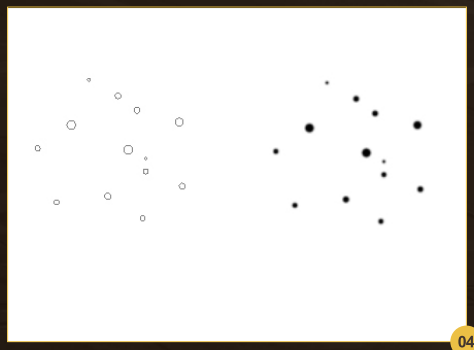

The best method is to use a few layers, but perhaps the quickest and easiest way to start is ZLWK WKH 1RLVH ¿OWHU , FUHDW , ¿OOHG ZLWK EODFN DQG WKHQ and added a value which suited the size of the render (Fig.02). This will comprise the farthest D\ ,I WH ZH will gradually move closer toward the camera.

At the moment the scene has far too many equidistant stars. By increasing the contrast and lowering the brightness it is possible to add some variety and depth (Fig.03).

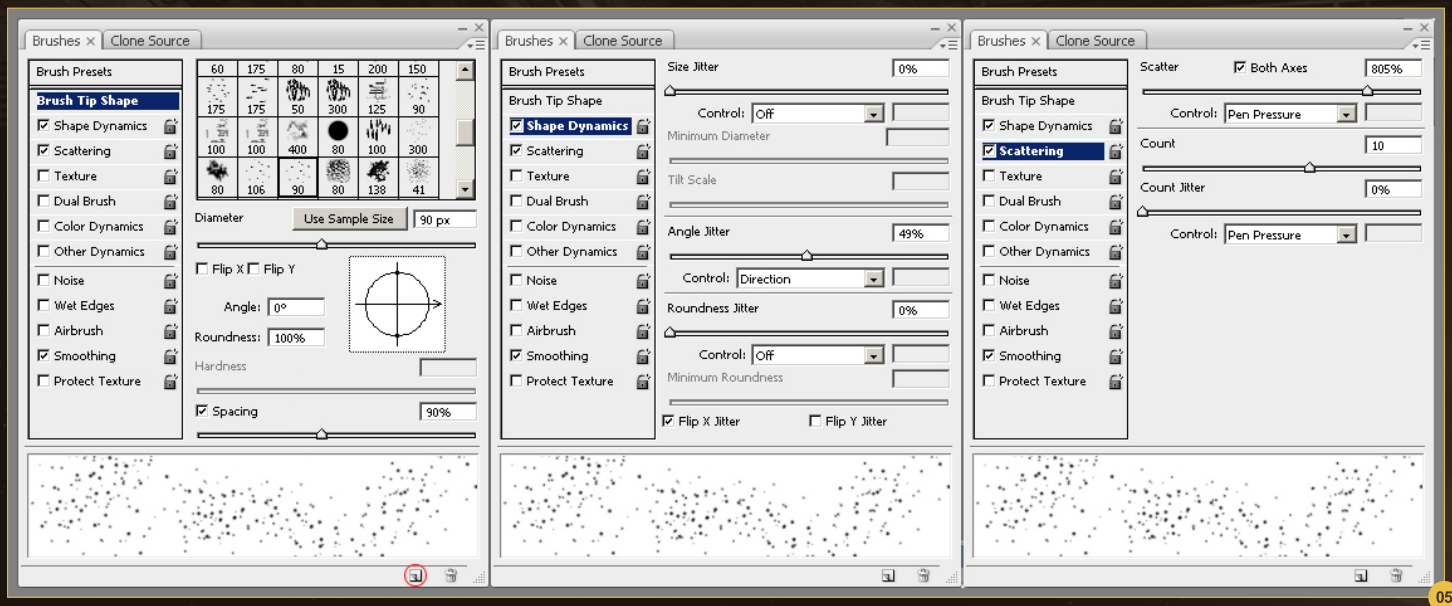

Another useful way of creating stars is by way of a custom brush. Using this approach I began by ,QLWLDOO\ ,G RU &WUOOW painting in a few random spots of varying sizes (Fig.04). This is turned into a brush by making a selection area DURXQG WKH GRWV DQG WKHQ JR Brush Preset and naming the brush.

03

04

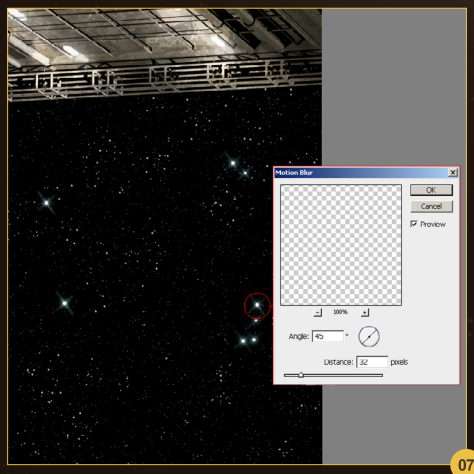

05

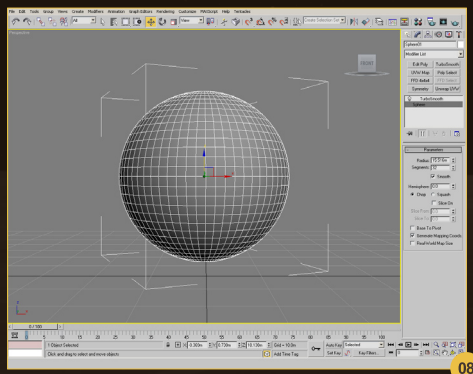

I then accessed the brush settings and altered the Brush Tip, Shape Dynamics and Scattering, using the parameters seen in Fig.05. Once done it is necessary to create a new brush by clicking the small icon ringed in red and saving out the brush once more in order to preserve the new settings.

A new layer can now be created and then the brush used to broadly paint in a larger group of stars. It is best to paint randomly across the designated area and not worry too much about

06

07

placement as you can always erase individual VWDUV ODWHU DQG UH¿QH WKHP ERWK EHIRUH DQG DIWHU ERROHDQLQJ 7KH EHVW practice is to use an eraser with no pressure sensitivity to fully delete certain stars and once you are happy, reduce the opacity in order to vary the brightness – as much depth as possible is the aim here (Fig.06).

08

7KH WKLUG DQG ¿QDO VHW RI VWDUV ERROHDQ LQWR WKH VFHQH DUH WKH VPDOOHVW largest, which appear nearest to the viewer. Using a hard round brush I added in a few dots and then duplicated the layer. Going to Filter > Blur > Motion Blur, I added a blur along a diagonal axis. This layer was then duplicated DQG ÀSSHG KRUL]RQWDOO\ WR FUHDWH D VXEWOH UHÀHFWLRQ HIIHFW (Fig.07). By keeping these on a separate layer you have the option of moving, duplicating and re-scaling them without affecting the rest add these alongside a nebula.

09

Planets

For the purposes of this tutorial we will have a look at creating planets in two different ways, which should suit most scenarios. First of all we will focus on how to create a distant planet before moving on to a close-up one. As this tutorial is aimed at 3D artists, this technique will seem elementary but very effective. In this instance I am using 3ds Max, but this method can be followed in any 3D package.

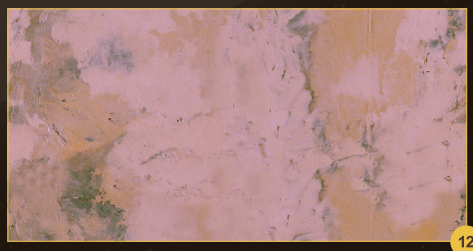

I created a standard sphere, ensuring I had the ³*HQHUDWH 0DSSLQJ &RRUGV´ ER then added some smoothing via Turbosmooth (Fig.08). Then I found a texture that resembled a planet (Fig.09). In my case this was a painted surface, but there are many textures that can work. For example, Fig.10 shows a stone surface that could be used to describe a desert

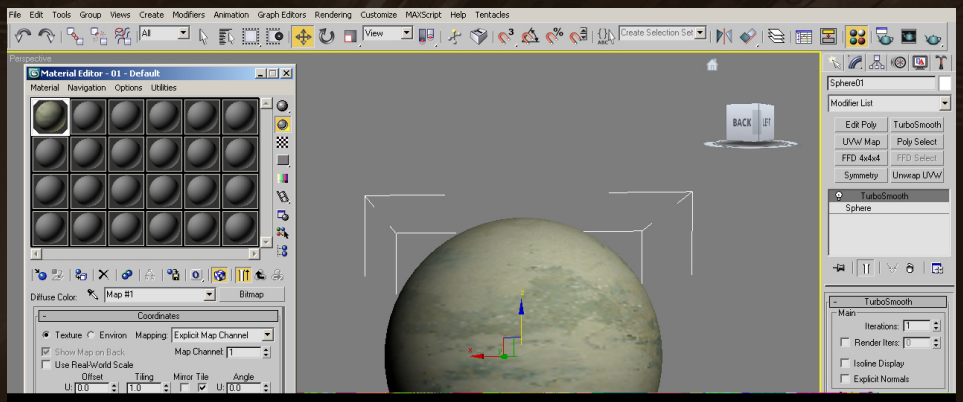

10

11

12

13

planet and Fig.11 is a stone wall that could be the basis for a moon. Fig.12 is similar to the one I chose, which could also work. I suggest picking up your digital camera and taking a stroll – you will be surprised at how many common and everyday surfaces can be transformed into a planet, especially with a macro lens!

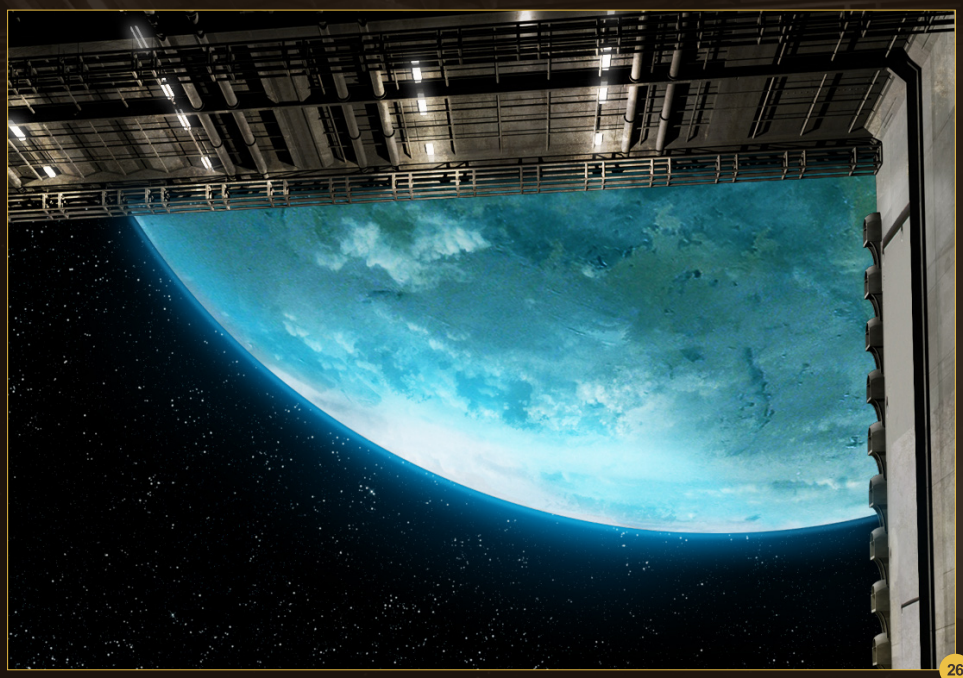

I applied the texture directly to my sphere without any UVW mapping and then rotated the DQJOH VR WKDW WKH JHQHUDO ÀRZ ZDV KRUL]RQWDO instead of vertical (Fig.13). Using the default OLJKWLQJ , KLW ³5HQGHU´ DQG WKHQ WKH SODQHW ZDV ready to be exported (Fig.14). If you wish to control the direction and intensity of light then some lights can be added into the scene. Once in Photoshop I duplicated the planet, darkened it slightly and then used a large soft airbrush to delete the lower left, which created a broader shadow across the upper right hemisphere (Fig.15).

14

15

We shall now add a planet in the foreground, but only show a portion of it due to the proximity DQG VR WKH ¿UVW WKLQJ WR GR

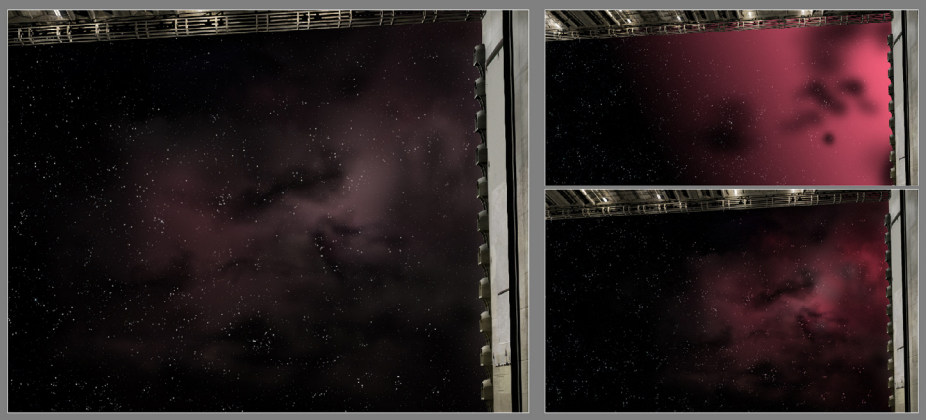

After deleting the line along the two right angles the planet was complete, which you can see here in Fig.26.

26

Nebula

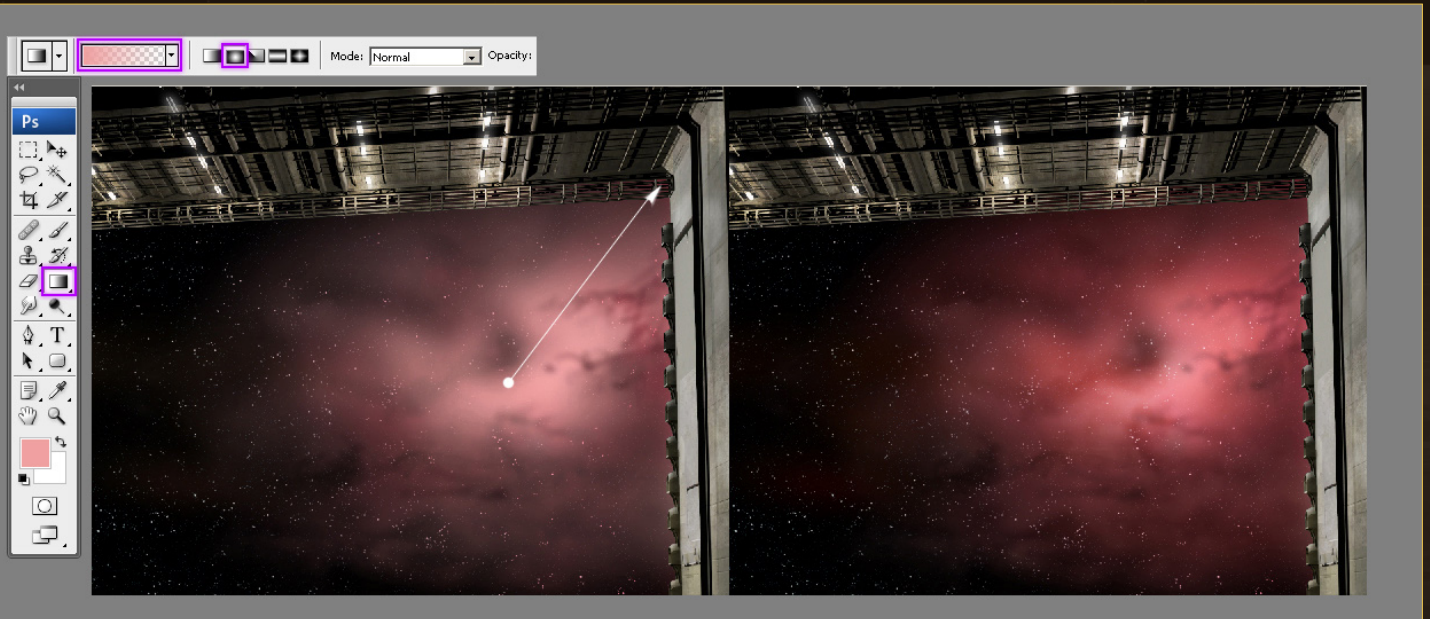

The last feature we will add into our scene as an alternative is a nebula, or interstellar cloud, which often appears very psychedelic in color. These vary dramatically, but are certainly a well-known feature of space and worth exploring. The great thing about nebulas is that they do not seem to have any discernible structure and so you can really be creative. The key technique is to separate out your layers and experiment with the blending modes and color schemes, as you will be able to produce a whole array of different clouds from a limited number of layers.

27

Fig.27 The first layer can be seen here, which is nothing more than few random strokes using a soft round airbrush with the opacity turned down to around 50%. I chose to use a dull purple, but any color works really depending on your desired effect.

On a separate layer I painted in a large cloud (upper right), which I faded out on one side before setting the blending mode to Overlay (lower right). A new layer was used to add a brighter area around the center and, using a Radial Gradient with a Foreground to

28

29

Transparent preset, I dragged from the middle outward using a pale pink, as shown in Fig.28. The blending mode was then set to Linear Light, which gave the nebula an ethereal glow emanating outward from the center. You will notice on the right that I used a soft eraser to reveal a few lines that look like clouds, which helps break up the symmetry a little.

The following four images (Fig.29) examine the process of building the detail using separate layers. In the first upper image, I created a small cloud using the same pink and blending mode apparent in Fig.28. The Soft airbrush is the best tool for this job, especially with the opacity turned down, as it conveys a quality that resembles the dispersion of gas.

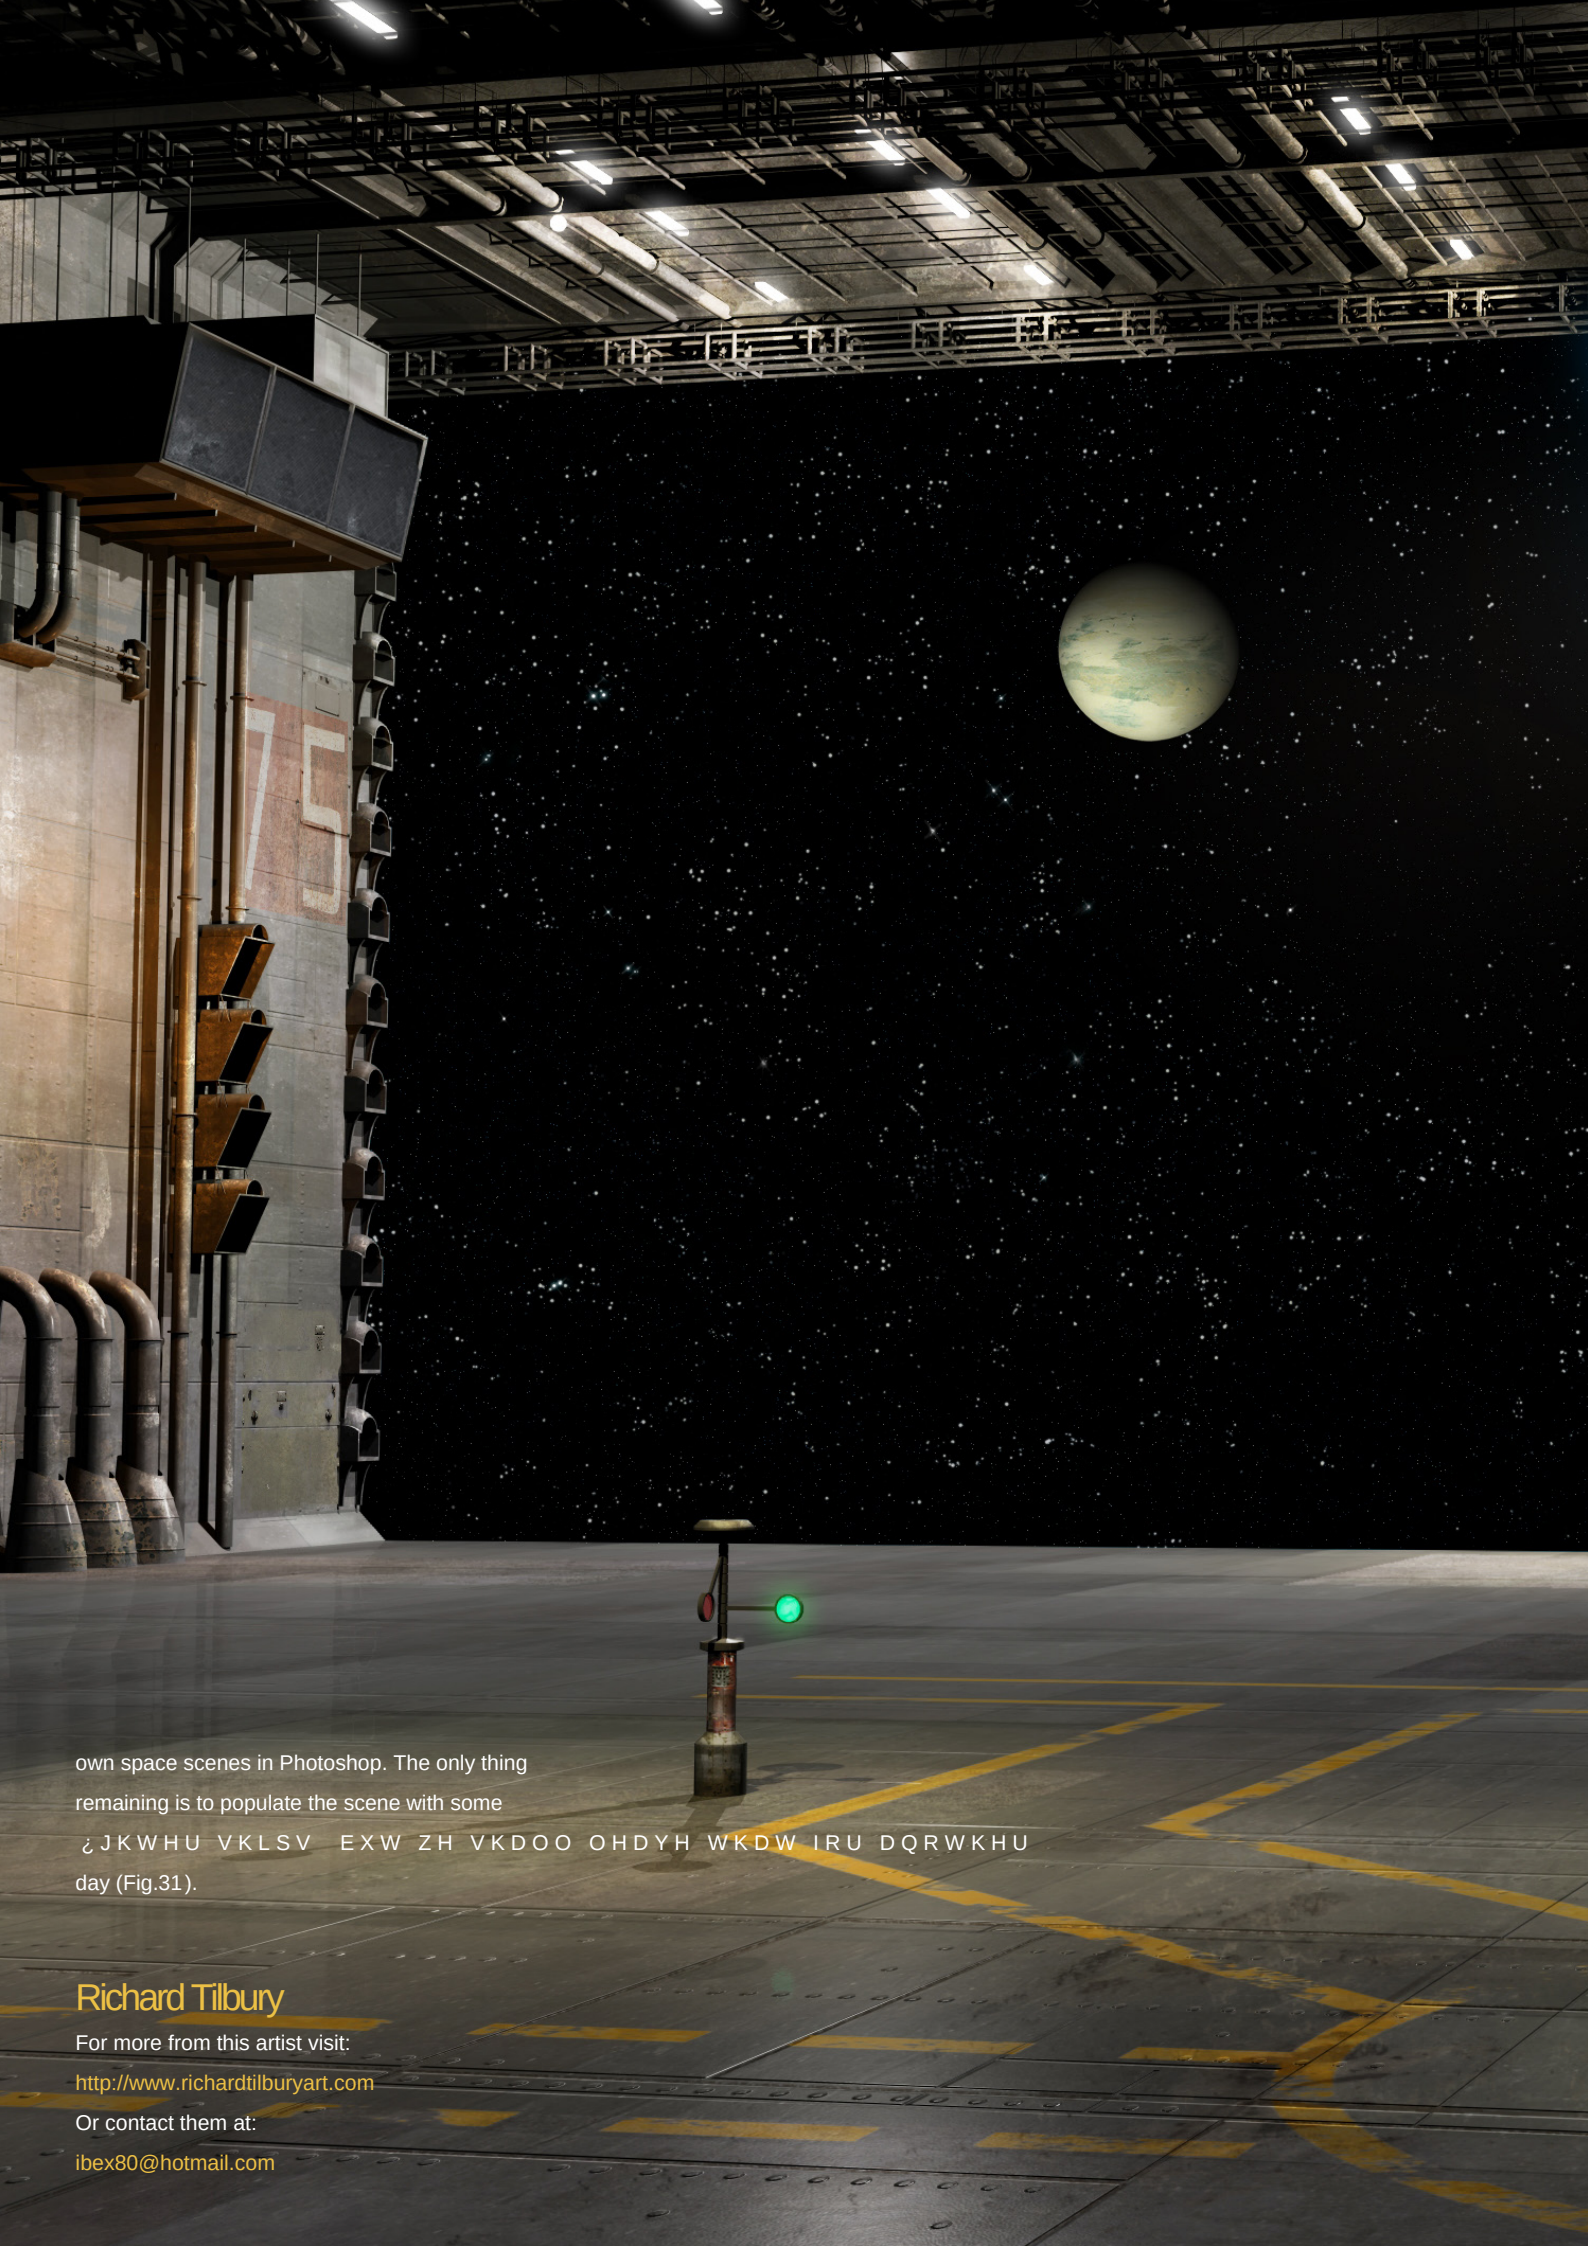

The next layer incorporated a different color, but this time the blending mode was set to Soft Light (upper right). The bottom two images reveal two sizes of star clusters, the largest being low on the left. These were done using the same techniques covered earlier in the tutorial, with the smaller of the two clusters utilizing the custom brush.

With the final version remaining intact, it is easy to experiment with the colors and change the composition (Fig.30).

This completes the tutorial, which I hope has given you some useful pointers for tackling your

30

own space scenes in Photoshop. The only thing remaining is to populate the scene with some ¿JKWHU VKLSV EXW ZH VKDOO OHDYH WKDW IRU DQRWKHU day (Fig.31).

CHAPTER 04

UNDERWATER SCENE

Chapter 04 - Underwater

Software used: 3ds Max & Photoshop

Introduction

This tutorial explores how to transform a regular scene into an underwater environment. We will begin with a base 3D render, which in this case is a scene created by Yannick Lecoffre that he has very kindly given us permission to use. The scene depicts a small bar in Paris and so we will imagine that through some terrible natural disaster the city has become engulfed by the sea and is now completely submerged. If we ignore the title it is also plausible to see the scene as a bar on a luxury ocean liner that has sunk and now resides at the bottom of the sea somewhere.

01

Fig.01 shows the original render by Yannick. We can see that the main light source is coming from the window on the right. If one was setting up a render in preparation for some Photoshop work, then it follows that the lighting and any special conditions would be set up beforehand in order to support the post-work and minimize the level of adjustment. Regarding the case in question, the light would probably have been less intense given the eventual conditions and perhaps there would have been some bottles DQG GHEULV ÀRDWLQJ DURXQG (Fig.02) to depict a scene that had been submerged for any length of time then you may also want to create some grunge textures to coat the furniture and walls, as well as some barnacles etc. However as we are transforming a render that was not been intended to be underwater ZH ZLOO DVVXPH LW KDV MXVW VHHQ à UHQGHU IURP \RXU ZDWW still looks quite pristine. We will also assume that the water is not too deep and so there is still a reasonable level of light streaming through the window, which will conform to the current lighting.

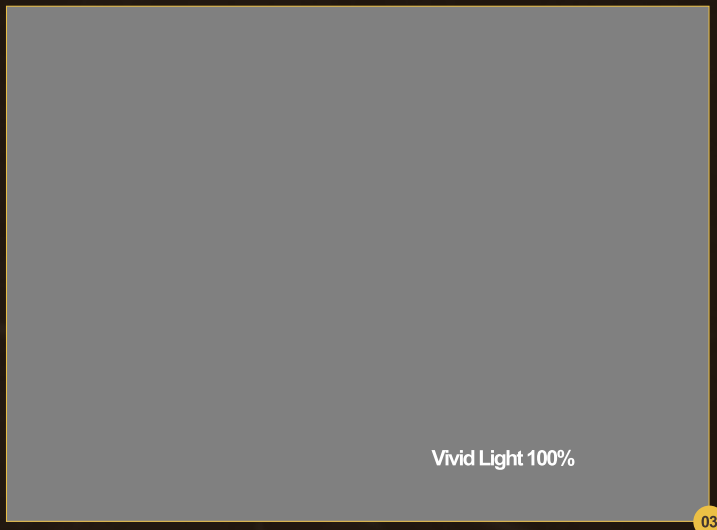

7KH ¿UVW SRUW RI FDOO LV WR GXSOLFDWH WKH UHQGHU VR I went to Image > Adjustments > Levels. Here I reduced the brightness of the overall image and narrow the tonal range to make the whites darker and the blacks a little lighter (Fig.02).

The next phase is to change the color scheme so that the scene looks as if it is underwater. To do this I created a new layer and then used the Gradient tool, making sure to select the Foreground to Background preset (Fig.03). I selected an aquamarine blue to be color for one end of the gradient and a slightly darker version for the opposite side, and then dragged this across the image, making sure that the lighter shade was on the window side. Once done I set the blending mode to Vivid Light at 100% opacity.

7KH ¿UVW SRUW RI FDOO LV WR GXSOLFDWH WKH UHQGHU VR As the light is now more diffuse and less intense it is necessary to restrict its effect further by darkening the foreground somewhat. I created a new layer and then, using the Gradient tool once more, I chose a dark green and dragged from the left-hand edge across to the opposite side. This time I used the Foreground to Transparent preset, which has been made visible on a white

02

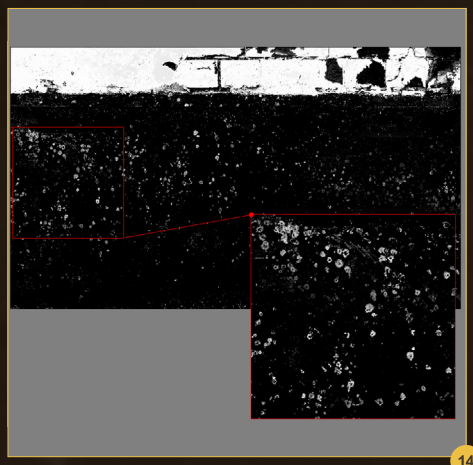

03

13

In order to give the picture a more realistic sense of being underwater it helps to degrade it somewhat by way of some subtle noise and blurring. I achieved this by selecting the levels

14

layer in Fig.02 and going to Filter > Noise > Add Noise (see settings in Fig.13). After applying this I went to Filter > Blur > Gaussian Blur and set the Radius to around 0.6. You can see the

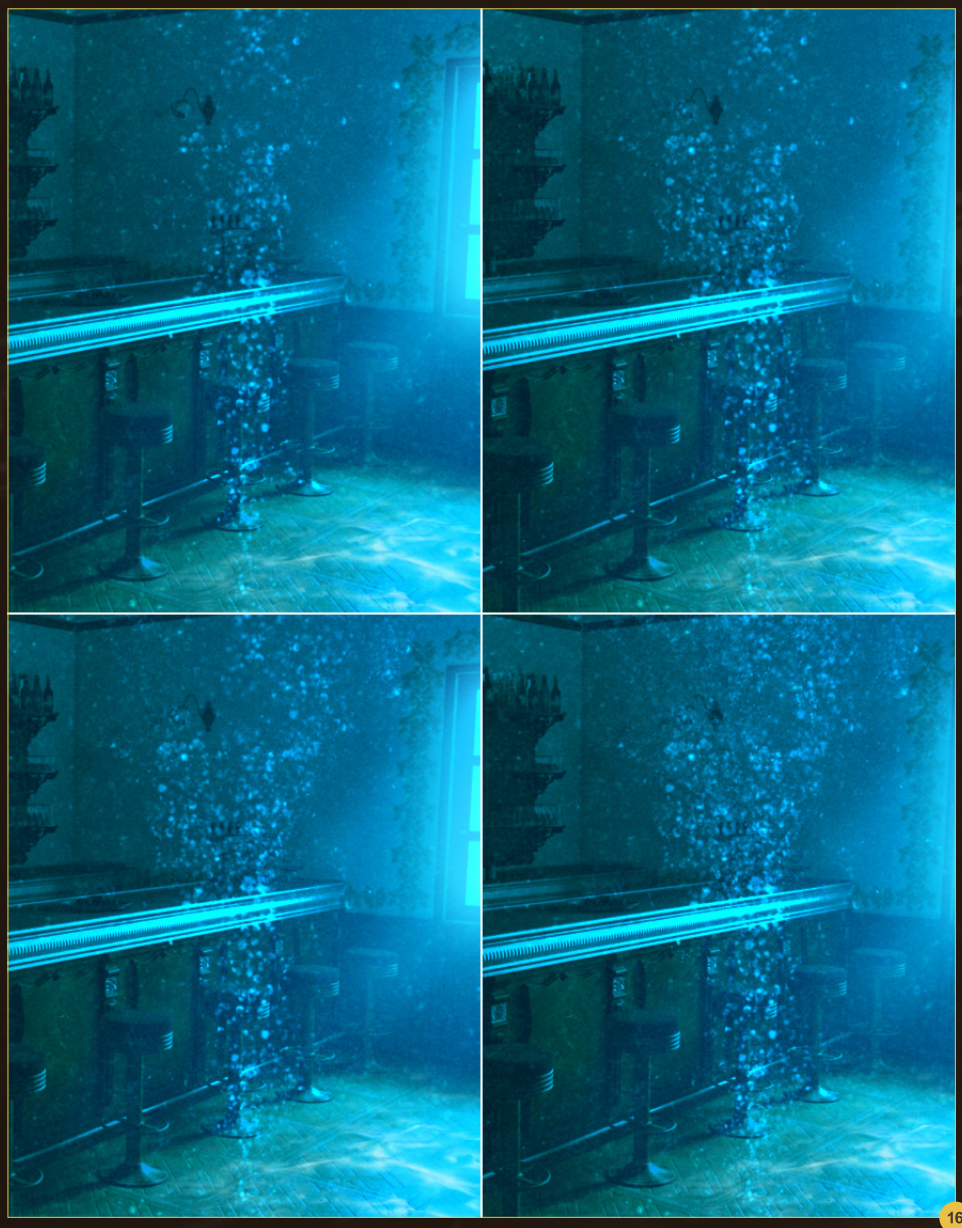

15

UHVXOW RI WKHVH WZR ¿OWHUV Fig.13, which includes the Dirt map particles, and compare it to the crisp version above. Another aspect that is also common to underwater environments is the sight of air bubbles. Ideally we would have a library of free images at hand that we could simply copy into our scene, but as these often carry restrictions we shall look for an alternative solution. I again turned to my trusted library of Dirt maps in order WR ¿QG VRPHWKLQJ WKDW FRXOG WKLV FDVH ZDV D PDS FDOOHG ³V (Fig.14).

7KH DUHD , ZDV VSHFL¿FDOO\ LQ section highlighted in red, which I felt could work DV DLU EXEEOHV 7KH ¿UVW VWDJ and pasting a selection area into the scene (see marquee in upper image in Fig.15). Once this section had been copied in I set the blending mode to Linear Dodge (1). These did not really resemble bubbles as they were too crisp and so I applied some Gaussian Blur (2).

Once done it was simply a case of duplicating and scaling them to create a stream rising upward (3). You can use the Clone Stamp tool to do this, or just copy and paste the original selection and then use the Eraser tool to modify the composition.

Fig.16 shows four stages that involve these steps. The top two images show the larger bubbles whilst the lower two show duplicates that have been scaled down and given a lower

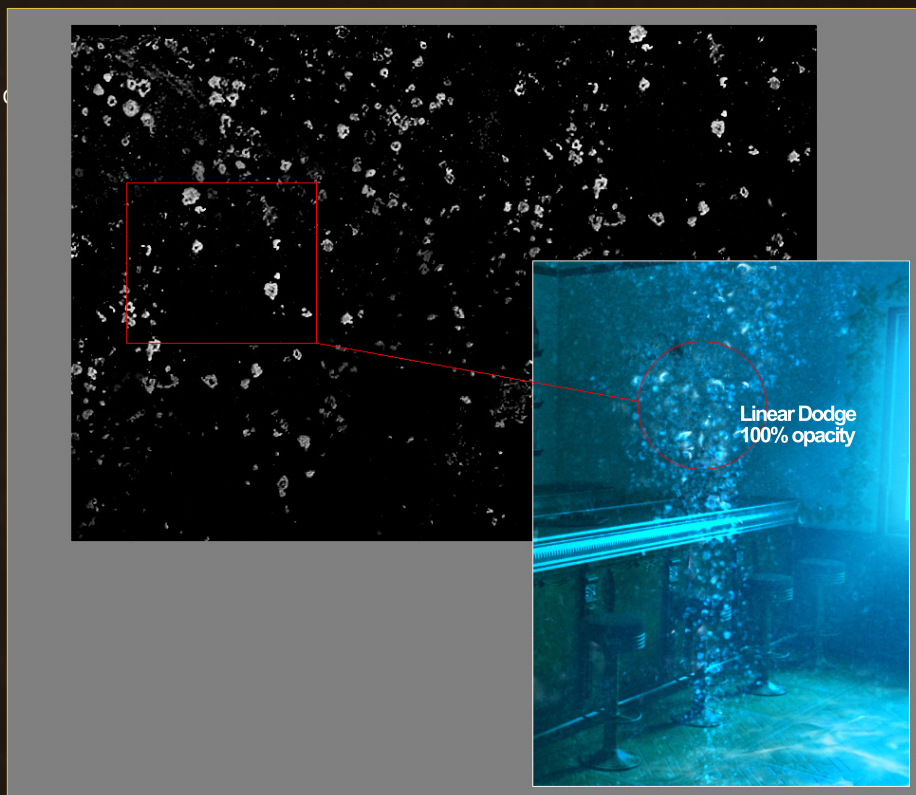

16

opacity to create the smaller bubbles. The entire stream was generated from the original Dirt PDS VHOHFWLRQ DQG PRGL¿H tools, namely Scale and Rotate.

The last phase involves adding some highlights across a few of the large bubbles, which again utilizes the same map. I selected an area that was composed of some of the brighter specs and ones that have a slight curvature, as indicated by the red rectangle in Fig.17. These are then set to Linear Dodge at 100% opacity and positioned so they look correct. I used the Eraser tool to form small arcs to replicate the shape of the bubbles.

One last additional layer will complete the transformation and constitute a few larger particles that are nearer the camera. To do this I selected an area on the map shown in Fig.11 and scaled it up so that the white areas were larger. Then I applied some generous blurring and set the blending mode to Linear Dodge at around 75% opacity.

This concludes the transformation of the bar into D ÀRRGHG FKDPEHU WKH ¿QDO UHVXOW RI ZKLFK can be seen here (Fig.18). I hope this tutorial has demonstrated how Photoshop and post-production can prove both a useful and valid alternative to 3D with respect to creating certain effects, and be of some help in your future projects.

The aim of this eBook is to show and explain how you might tackle rigging your 3D character for animation. The six chapters within this eBook will give help and advice to novices and experts who are looking to build on their
approach rigging but also shows us how to tackle common problems and issues that regularly occur even in a
their individual approaches to creating the best rigs possible.

Original Author: 3DTotal.com Ltd | Platform: 3dsmax and Maya | Format: DOWNLOAD ONLY PDF

This e-book provides a detailed account of building, texturing and lighting the interior of a Gothic Church based
of the character, highlighting the various brushes and tools used throughout.
